*If you know your table manufacturer name and style number, you do **not** need to give us this measurement. We may already have it on file.*

**1. Cut out the 45° Corner Tester** on page 2 and place it precisely on one of your table's corners, only on the flat top surface.

**2. Make sure your table edges line up exactly with the 45° Corner Tester.** In this step we want to *make sure* your clipped corners are cut off at a 45° angle—if not, we will need a pattern of the complete half of the main table. (See instructions on our website.)

**3. Measure the length of your clipped corner using a metal tape measure.**

**4. Give us the length.**
